

Test Plan – Knihobot Website

Test Plan – Knihobot Website

Project Overview

This project focuses on testing the publicly accessible Knihobot website for educational and portfolio purposes. Testing was performed only through the publicly available user interface without access to internal systems, databases, source code, or administrative functionality.

The purpose of this project is to demonstrate manual testing skills and basic test automation techniques while respecting the limitations of testing a production website without official authorization.

Testing Objectives

The main objectives of testing are:

Verify that core website functionality works correctly.

Validate navigation and page transitions.

Verify search and filtering functionality.

Validate forms and user input handling.

Identify UI/UX inconsistencies.

Detect functional defects.

Create a foundation for automated end-to-end testing.

Test Environment

Website: <https://knihobot.cz>

Browser: Google Chrome (latest stable version)

Device: Desktop

Operating System: Windows 11

Testing Types

The following testing types were performed:

Functional Testing

UI Testing

Exploratory Testing

Usability Testing

Basic Automation Testing (Playwright)

Scope of Testing

Included in Scope

Homepage

Navigation menu

Search functionality

Filters and categories

Product pages

Public forms

Internal links

Basic responsive behavior during desktop testing

Test Coverage

The current testing scope includes:

177 manual test cases covering the main user flows of the website.

Functional testing of public website features.

UI and usability validation.

Exploratory testing sessions.

Documentation of identified defects through structured bug reports.

Test execution summary and observations.

A selected set of scenarios identified as candidates for future automation using Playwright with Python.

The test cases cover the following functional areas:

Homepage

Navigation

Authentication

Search

Filters and Sorting

Catalog Navigation

Product Cards

Product Detail Page

Shopping Cart

Basket Form

Account & Profile

Out of Scope

The following activities were intentionally excluded because the project was performed without official authorization and only through the public interface:

Security testing

Penetration testing

Stress and load testing

Performance benchmarking

Payment processing validation

Database testing

API testing (private endpoints)

Administrative functionality

Automation Scope

The following scenarios have been selected for future automation using Playwright with Python:

Navigation scenarios

Search validation

Basic form interactions

Link validation

UI element verification

End-to-end user scenarios

Entry Criteria

Testing can begin when:

The website is publicly accessible.

Test data is prepared.

Required testing tools are available.

The test environment is stable.

Exit Criteria

Testing is considered complete when:

All planned test cases have been executed.

Test results have been documented.

Identified defects have been reported.

Test Summary Report has been completed.

Risks

Potential risks include:

Changes to the production website during testing.

Limited access to internal functionality.

Dynamic content affecting test stability.

Lack of access to backend logs and databases.

Inability to perform intrusive testing without official authorization.

Defect Management

All identified defects are documented in the bug-reports section.

Each defect record includes:

Bug ID

Title

Severity

Priority

Environment

Steps to Reproduce

Expected Result

Actual Result
